I was curious if this is a potential hack of the latest version of Windows. I'm not sure if the what the default password is, or if it is really a bug. A: This is a bug. There was actually a password tied to this "DEFAULT" account some time in the past, but it has since been disabled. If you can't verify that it's actually a bug, you could add a file called "NO_PASSWORD" to the root of your disk with some text. Then you would tell users not to store a password in this file, just so they can create it to see if it works. You can do it by editing /etc/passwd and /etc/shadow in CMD. As example: C:\> edit /etc/passwd (or whatever your /etc/passwd file is named) C:\> set
