Power generators, also known as power sources, are items used to generate power. They have been a feature of The Elder Scrolls series since Morrowind, including in Fallout 4. There are three types of power generator in Fallout 4: electricity, mechanical and gas. Each of these types of power generators has different components, but essentially they all serve a similar purpose. There are two types of gas power generators: those powered by a fuel and those that emit a toxic gas. When looking at a generator in The Elder Scrolls, there is usually a power meter that measures how much power the generator is generating (or how far it has generated power). Some generators have bars that fill up to indicate how much power has been generated. It is important to take note of these generators because they can be used later to purchase power boost items. The directions for how to access the generator in Fallout 4 can be found in the patch notes for the expansion on Steam: Expansion Patch Notes. Sometimes, gas power generators will not operate unless there is a visual cue to show power is being generated. This is the same for both the visual cue for generation and the sound cue for generation (although I can't recall any gas power generators that produce a sound cue). When a generator is providing power, it will have a yellow power meter. When the generator has generated power for a short time period, it will then turn blue and stay blue while the power is being generated. If a generator gives up power, it will lose its yellow color. A generator can be repaired and it will regain its color, although it will not change its color in the middle of being repaired. .
