It is a tool that allows the user to calculate

the square of given numbers.

PERISCOPE: A powerful and easy to use telescope tracking software. PERISCOPE is a FREE and Open Source telescope tracker. It supports SLINK, DASK, DQDS and others. PERISCOPE offers many useful features to help you use a telescope, but it can be easily used in small facilities.

PrettyPrint is a program that works in a simple fashion. It prints ASCII characters and other objects, including the style of the text, to a file. Its purpose is simply to save characters as a character file for later use.

You can also print text from the terminal.

The printout is colorful and easy to read. SAS (Standard Analysis System) is a set of programs to compute descriptive statistics for groups of data. SAS is based on the

SIMULATE system, originally developed by the University of Minnesota. The procedures support many statistical tests including the analysis of variance, regression, sampling distributions, and survival analysis. 'S' is a program which allows the user to calculate the random numbers inside a data set of his choice. It is a mathematical realization of the method called the Gaussian sampler. A is the same program which can also be used as an interface to the random number generator. 'S' and 'A' are simply front ends to the gaussrandom program. The code of the program is very simple and is therefore well suited for scientific computing. Vector-calculus is a computer program for the calculation of vector calculus. It is

written in Fortran 90. It is an extension of Mathematica's Vector function, VEC2, VEC3 and VEC4. Vector-calculus has got an extensive help file with documentation. Vector-calculus runs on all major versions of Windows. Vector-calculus comes with a large number of basic examples. All vectors are handled in mathematically accurate ways and thus can be combined with all other programs from Mathematica. The Atmospheric Program (code name GALAPAGOS) is a set of programs developed to compute the effects of the variation of the atmospheric and solar constituents, including clouds, radiation, aerosols, dust, etc., on the distribution of optical properties. GALAPAGOS is based on the work of Aarhus Atmospheric

----- This is a utility for calculating the square root of a number. There are several problems with the traditional "brute force" methods of calculating square roots:

1. Computational time.
2. Accuracy.
3. Potential for forgetting the process of calculating the square root and proceeding on to do something else, so that the calculation is never completed.
4. And the most important... The ability of users to quickly calculate a square root of numbers.

pxcalc has 2 key components to help a user achieve his/her goal.

1. The ability of the user to input the numbers to be squared.
2. The ability to quickly display the square root of the numbers as a result.

pxcalc has

the ability to show the square root of numbers as follows: 1. Display a dialog asking the user to enter the first number to be squared. 2. Display a dialog asking the user to enter the second number to be squared. 3. Display the square root of the two numbers as a dialog box. 4. Dismiss the dialog boxes and display the square root of the two numbers as a result. pxcalc has the ability to calculate the square root of numbers from: 1. A single digit number. 2. Multiple digit numbers. 3. Decimal numbers. 4. Hexadecimal numbers. 5. Whole numbers. 6. Short numbers. 7. Long numbers. 8. Short text numbers. 9. Long text numbers. 10. Doubles. 11. Triples. 12. Octaves. 13. Currency values. 14. Rounded numbers. 15. Commas. 16. Semicolons.

17. Dashes. 18. Empty brackets. 19. Open brackets. 20. (optional) Escaping parenthesis 21. (optional) Escaping brackets 22. (optional) Escaping parentheses 23. (optional) Escaping quotient 24. (optional) Escaping exponent 25. (optional) Padding with zeros. 26. (optional) Left padding. 27. (optional) Right padding. 28. (optional) Zero padding. 29. (optional) Positive padding. 30. (optional) Negative padding. 31. (optional) Consecutive zeros. 32. (optional) Consecutive zeros and leading zeros
