What's New in the Brain Programmer?

Brain Programmer is a data acquisition, visualization, and data analysis software, primarily designed to assist neuroscientists in the development and analysis of large-scale brain networks. Brain Programmer captures both the experimental data and the program outputs, and stores all the data with specific parameters in a single folder (n name), with the ability to directly import to downstream analysis programs. A set of different export functions allow the user to export the experiment-specific data as a text file, as an image file, as a comma-separated value file, as a csv file or as a graph file. The software features a smart interactive interface and a graphical user's interface, allowing for a fully programmatic interaction. "Brain Programmer is an amazing program that did what no other program could do. It managed to capture and read the information out of my brain and the programs gave me tools that helped me process and understand this data. It is a must have program that I would recommend to anyone that is in the same field as me." "I thought Brain Programmer would be really hard to use but I was very pleasantly surprised when the first program I ran through it worked perfectly. This software is an amazing piece of work and I wish every neuroscientist was as innovative as you are" "Brain Programmer helped me tremendously as a result of its amazing brain recording abilities. It allowed me to automatically track what I did and what I was thinking, which was a bit mind blowing. This program has certainly changed my research practice and pushed my brain imaging abilities to new limits!" Brain Programmer is a brain recording software designed for neuroscientists. Brain Programmer captures brain activity from EEG, ECoG, and MEG recordings, and contains a graphical user interface that enables a more user-friendly recording and analysis of brain activity. Brain Programmer allows for a programmatic generation of data in a flexible manner, including the ability to extract time-series data from any point in time during the experiment, providing control over the time points and the number of samples for a data capture. Brain Programmer also facilitates post-processing of the extracted data and provides a variety of graphical representations of the data.
